Care. Protection. Quality.

TABLET / PELLET

- No ozone layer depletion
- Seamed aluminium lid for 100% gas tightness goods
- Recommended for use with DEGESCH® Automatic Dispenser

PRODUCT INFORMATION

PHOSTOXIN® tablets and pellets commence developing phosphine after a short delay when exposed to the atmosphere depending on the temperature and humidity. Due to the small size of the pellets, decomposition is more rapid compared to tablets. Phosphine controls all developmental stages of stored product pests. Phosphine penetrates packing material as well as densely packed commodities.

PHOSTOXIN® pressed compounds are produced in two different shapes: pellets and round tablets. They are packed in gas-tight flask from 90g to 1000g with special sealing to guarantee its quality.

FIELD OF APPLICATION

The use of PHOSTOXIN® tablets and pellets is not limited to any particular type of storage if gas tightness could be ensured.

They can be applied in silo installations, warehouses, containers, ships, etc. either by hand or inserted automatically.

DOSAGE AND EXPOSURE TIME

Dosage and exposure time depend on a number of factors such as temperature and humidity, type and sealing of storage, commodity and packing, type of stored product pest to be controlled.

The speed of decomposition depends on two factors, namely, the humidity and the temperature of the room respectively the commodity. The higher the humidity and temperature, the faster the decomposition takes place.

Detia Degesch has developed its recommended standard dosage and exposure time to achieve successful fumigation. The summary of a good fumigation practice is documented in the Detia Degesch Fumigation Standard.

N°1 FUMIGATION SOLUTIONS WORLDWIDE
